

Field Study at Cheung Chau

To share and exchange ideas between senior and junior form students and cultivate students' interest in Geography, six S4 and S5 students taking Geography subject designed a field study in Cheung Chau. Students planned the route, and designed the worksheets by themselves. On 17th November, the six students act as the tutor of twenty-two junior form students. They visited Cheung Chau and observed the rocks (人頭石、花瓶石), land use, vegetation, coastal depositional landforms and erosional landforms. They guided the junior students to explore the relationship between human and the environment and promoted the preservation of rocks and the environment. All the students gained great experience in the trip.
